

Bengaluru Ride-Booking Analytics & Performance Report

A data-driven review of ride bookings, cancellations, revenue and service quality across Bengaluru — June 2026

Report period	01 – 30 June 2026
Coverage area	Bengaluru city — 50 zones
Total records analyzed	100,000
Prepared for	Data Analytics Portfolio
Report date	04 July 2026

1. Executive Summary

This report analyzes 100,000 ride-booking records generated for Bengaluru city over a 30-day period in June 2026, covering seven vehicle categories (Auto, Bike, eBike, Mini, Prime Plus, Prime Sedan and Prime SUV) across 50 city zones. The dataset captures the full booking lifecycle — from request to completion, cancellation, or drop-off failure — along with fare value, trip distance, turnaround times, and customer/driver ratings.

Of all bookings raised, **62.3%** (62,292 rides) were completed successfully, generating a total booking value of **■16.53 million**. The remaining **27.7%** of trips were cancelled — split between customer-initiated (9,911 rides) and driver-initiated (17,793 rides) cancellations — while a further **10,004** rides were marked incomplete after being accepted.

100.0K	■16.53M	62.3%	27.7%
Total Bookings	Total Booking Value	Success Rate	Cancellation Rate

Key Findings

- Mini, Auto and Bike together account for the majority of ride volume and revenue, reflecting Bengaluru's demand mix toward affordable, point-to-point city mobility.
- Driver-initiated cancellations (17,793 rides) run nearly double customer-initiated cancellations (9,911 rides), suggesting driver-side friction is the larger lever for improving completion rates.
- Average VTAT (vehicle arrival time) stands at 8.0 minutes and average CTAT (customer arrival time) at 15.0 minutes for successful rides — both within acceptable urban mobility benchmarks.
- Customer and driver satisfaction are stable and consistent across all vehicle types, averaging 4.00/5 and 4.00/5 respectively, indicating no single vehicle category is a service-quality outlier.
- Cancellation reasons are fairly evenly distributed on both sides (customer and driver), pointing to operational/process issues rather than one dominant root cause.

2. Data Overview & Methodology

The dataset was structured to mirror real-world ride-hailing operations and was validated for PostgreSQL compatibility ahead of analysis. Each record represents a single booking attempt.

Dataset Structure

Attribute	Detail
Time period	1 – 30 June 2026 (30 days)
Geography	Bengaluru city, 50 pickup/drop zones
Total records	100,000
Vehicle categories	Auto, Bike, eBike, Mini, Prime Plus, Prime Sedan, Prime SUV
Unique customers	~42,000
Key fields	Date, Time, Booking ID, Status, Customer ID, Vehicle Type, Pickup/Drop, VTAT, CTAT, Cancellation Reason

Business Logic Applied

- Overall booking success is fixed at ~62%, matching typical ride-hailing completion benchmarks.
- Fare, distance, VTAT/CTAT, and rating fields are populated **only** for successful bookings — cancelled and incomplete rides correctly show no fare or rating data.
- "AC is not working" is restricted as a cancellation reason to 4-wheeler categories (Prime Sedan, Prime Plus, Prime SUV) only, since Auto/Bike/eBike have no AC.
- Pickup and drop locations are always distinct, drawn from 50 real Bengaluru micro-markets (Koramangala, Indiranagar, Whitefield, Electronic City, HSR Layout, etc.).

Analysis Tools

Data was generated and validated using Python (pandas, NumPy), stored in PostgreSQL-ready CSV format, and visualized through both this report and an interactive Power BI dashboard covering Overall, Vehicle Type, Revenue, Cancellation, and Ratings views.

3. Booking Status Analysis

Out of 100,000 total bookings raised in June 2026, 62,292 (62.3%) were completed successfully. The remaining bookings were split across driver cancellations, customer cancellations, and incomplete rides.

Left: Booking status breakdown. Right: Daily ride volume trend across June 2026.

Booking Status	Count	% of Total
Success	62,292	62.29%
Cancelled by Driver	17,793	17.79%
Incomplete	10,004	10.00%
Cancelled by Customer	9,911	9.91%

Observation

Ride volume fluctuates in a tight daily band (~3,200–3,500 bookings/day) with no strong weekly seasonality, indicating stable, consistent city-wide demand across the month rather than sharp weekday/weekend swings.

4. Vehicle Type Performance

Vehicle-level performance was assessed on total bookings, revenue contribution, and average trip distance to understand which categories drive the platform's volume and value.

Vehicle Type	Bookings	Booking Value	Avg. Distance (km)	Total Distance (km)
Mini	21,868	■3.63M	18.01	245.8K
Auto	20,027	■3.30M	18.12	224.2K
Bike	18,056	■2.95M	17.82	200.0K
Prime Sedan	11,917	■1.99M	18.14	135.5K
Prime Plus	12,049	■1.99M	17.98	135.1K
Prime SUV	8,063	■1.34M	17.89	90.7K
eBike	8,020	■1.32M	18.00	89.9K

Booking value contribution by vehicle category (successful rides only).

Observation

Mini, Auto and Bike are the platform's volume drivers, jointly contributing the bulk of successful bookings and revenue — consistent with their positioning as everyday, budget-friendly options. Premium categories (Prime Sedan, Prime Plus, Prime SUV) and eBike carry lower volumes but maintain near-identical average trip distances (~18 km) to standard categories, suggesting premium demand is driven by comfort preference rather than trip length.

5. Revenue Analysis

Total booking value across the month reached **₹16.53 million**, generated entirely from the 62,292 successfully completed rides.

Top 5 Customers by Booking Value

Customer ID	Total Booking Value
CID134606	₹3,436.15
CID110289	₹3,098.62
CID101643	₹2,790.20
CID122685	₹2,519.67
CID104044	₹2,360.62
Total	₹14,205.26

Observation

Daily booking value is remarkably stable through the month (no major spikes or troughs), reflecting consistent ridership rather than event-driven demand. Revenue concentration among top customers is low — the top 5 customers together represent a very small share of the **₹16.5M** total — indicating a broad, well-distributed customer base rather than dependency on a few high-frequency riders.

6. Cancellation Analysis — Customer-Initiated

Customers cancelled 9,911 bookings during June (9.91% of all bookings). Reasons are broadly spread across four operational categories, with one clear outlier.

Cancellation Reasons — Customer

Reason	Count	Share
Driver is not moving towards pickup location	2,390	24.1%
Driver asked to cancel	2,344	23.7%
Wrong Address	2,265	22.9%
Change of plans	2,262	22.8%
AC is not working	650	6.6%

Observation

"Driver is not moving towards pickup location," "Driver asked to cancel," "Wrong Address," and "Change of plans" are nearly evenly split (~22–24% each), while "AC is not working" accounts for a much smaller share — expected, since it can only apply to 4-wheeler bookings. This spread suggests customer-side cancellations are driven more by driver behaviour and logistics issues than by vehicle condition complaints.

7. Cancellation Analysis — Driver-Initiated & Incomplete Rides

Drivers cancelled 17,793 bookings (17.79% of all bookings) — nearly double the customer cancellation volume — making this the larger of the two cancellation channels.

Cancellation Reasons — Driver

Driver Cancellation Reason	Count	Share
The customer was coughing/sick	4,485	25.2%
Personal & Car related issues	4,478	25.2%
Customer related issue	4,466	25.1%
More than permitted people in there	4,364	24.5%

An additional 10,004 rides (10.00% of all bookings) were accepted but not completed.

Incomplete Ride Reasons

Incomplete Ride Reason	Count	Share
Other Issue	3,413	34.1%
Customer Demand	3,296	32.9%
Vehicle Breakdown	3,295	32.9%

Observation

The four driver cancellation reasons are almost perfectly evenly distributed (~24–25% each), with no single dominant cause. Combined with driver cancellations outweighing customer cancellations 1.8:1, this points to supply-side friction — driver availability, vehicle condition, and passenger-count mismatches — as the primary lever for reducing the overall 27.7% cancellation rate.

8. Ratings & Service Quality

Across 62,292 successful rides, the platform maintains a healthy average customer rating of 4.00/5 and driver rating of 4.00/5. Turnaround times average 8.0 minutes for vehicle arrival (VTAT) and 15.0 minutes for customer arrival (CTAT).

Vehicle Type	Avg VTAT (min)	Avg CTAT (min)
Auto	8.02	15.07
Bike	8.05	15.04
Mini	8.01	15.00
Prime Plus	7.91	14.90
Prime SUV	7.97	15.06
Prime Sedan	7.95	14.91
eBike	8.05	15.07

Observation

Ratings sit within a very narrow band (3.99–4.01) across every vehicle category for both drivers and customers — there is no vehicle type dragging down service perception. This consistency indicates the cancellation issues identified in Sections 6–7 are largely operational/logistical rather than symptoms of poor service quality once a ride is actually completed.

9. Conclusion & Recommendations

The Bengaluru ride-booking dataset for June 2026 shows a platform with a stable demand base (~3,333 bookings/day), a healthy 62.3% completion rate, and consistently strong service ratings across all vehicle categories. The primary opportunity for improvement lies in reducing the 27.7% overall cancellation rate, which is weighted more heavily toward driver-side cancellations than customer-side ones.

Recommendations

- **Prioritize driver-side interventions** — since driver cancellations outnumber customer cancellations nearly 2:1, focus retention efforts on driver vehicle-maintenance support and clearer trip-acceptance screening to reduce "personal & car related issues."
- **Address pickup-navigation friction** — "Driver is not moving towards pickup location" and "Wrong Address" together account for a large share of customer cancellations; improving in-app navigation and address verification at booking time could meaningfully cut this category.
- **Monitor incomplete rides as a distinct funnel** — with reasons split almost evenly across customer demand, vehicle breakdown, and other issues, incomplete rides deserve their own tracking rather than being grouped with cancellations, since the intervention needed differs by cause.
- **Maintain current service-quality standards** — ratings are uniformly strong, so quality-of-service is not a growth constraint; effort is better spent on completion-rate and operational fixes than on in-ride experience.
- **Continue monthly trend tracking** — extending this analysis across multiple months would help distinguish seasonal cancellation patterns from persistent operational issues.

This report and its companion Power BI dashboard were built as part of a data analytics portfolio project, demonstrating end-to-end capability from synthetic data generation and PostgreSQL modeling to business intelligence reporting and written analysis.
